Engineering MCA IEEE 802.11 standard, popularly known as WiFi, lays down the architecture and specifications of wireless LANs (WLANs). WiFi or WLAN uses high-frequency radio waves instead of cables for connecting the devices in LAN. Users connected by WLANs can move around within the area of network coverage.

Wireless networks are also more flexible, faster and easier for you to use, and more affordable to deploy and maintain. The de facto standard for wireless networking is the 802.11 protocol, which includes Wi-Fi (the wireless standard known as 802.11b) and its faster cousin, 802.11g.

802.11n (also sometimes known as Wireless N) was designed to improve on 802.11g in the amount of bandwidth it supports, by using several wireless signals and antennas (called MIMO technology) instead of one. Industry standards groups ratified 802.11n in 2009 with specifications providing for up to 600 Mbps of network bandwidth. 802.11n also offers a somewhat better range over earlier Wi-Fi standards due to its increased signal intensity, and it is backward-compatible with 802.11a/b/g gear.

Wireless networks typically have a great deal of flexibility, which can translate into rapid deployment. Wireless networks use a number of base stations to connect users to an existing network. (In an 802.11 network, the base stations are called access points.) The infrastructure side of a wireless network, however, is qualitatively the same whether you are connecting one user or a million users.

In IEEE 802.11 wireless local area networking standards (including Wi-Fi), a service set (also known as extended service set or ESS) is a group of wireless network devices which are identified by the same SSID (service set identifier). SSIDs serve as "network names" and are typically natural language labels.

The 802.11 Wireless LAN working group came into existence in 1991 to create standards for 1 MB/sec Radio Frequency (RF) based data network technology. An 802.11a Wi-Fi network supports a maximum theoretical bandwidth of 54 Mbps, substantially better than the 11 Mbps of 802.11b and on par with what 802.11g would offer a few years later. The performance of 802.11a made it an attractive technology but achieving that level of performance required using relatively expensive hardware.
